# 01 / Executive direction

**ASR LABS** is an independent educational media brand that makes complex technology understandable through research-led storytelling. It connects artificial intelligence, science, emerging technologies and human stories, with a distinctive editorial focus on women innovators.

## Operating objective

Build a repeatable, quality-controlled publishing engine that releases **two original short-form videos every day**: one at **08:00 IST** and one at **20:00 IST**. The system should help the founder move from idea to verified, approved, published content without sacrificing accuracy or creative quality.

## Brand system

| COLOUR | HEX | ROLE |
|---|---|---|
| Midnight Ink | #10101B | Primary backgrounds, title cards, premium contrast |
| Deep Violet | #6D4AFF | Primary brand accent, buttons, section markers |
| Electric Lavender | #9B7BFF | Highlights, gradients, data accents |
| Signal Blue | #4C8DFF | Technology, diagrams, research and data cues |
| Soft Gold | #D7B56D | Editorial emphasis, founder approval, premium detail |
| Cloud White | #F7F6FB | Reading surfaces, cards, documents |

**Visual language:** clean editorial typography, strong contrast, precise grids, thin technical lines, subtle orbital/circuit motifs, generous whitespace and restrained gradients. Avoid cluttered sci-fi clichés, excessive glow, random stock imagery and unreadable text overlays.

# 02 / Editorial architecture

Five repeatable content pillars create a recognisable channel while allowing a balanced mix of evergreen explainers, timely discoveries and human stories.

| PILLAR | MIX | WHAT WE MAKE |
|---|---|---|
| Women Who Built the Future | 25% | Profiles of women scientists, engineers, inventors and technology founders. |
| AI Decoded | 25% | Clear explainers on LLMs, AI agents, machine learning, generative AI and practical use. |
| Beyond Tomorrow | 20% | Robotics, quantum computing, space, chips, materials and emerging research. |
| AI for Humanity | 20% | Real-world applications in healthcare, education, climate, accessibility and agriculture. |
| The Founder Journal | 10% | Behind-the-scenes experiments, building ASR LABS, lessons and transparent progress. |

# 03 / Daily video programming

Two daily videos should serve different viewer moments, rather than publishing the same cut twice. Both are original, vertical-first videos and can be adapted for YouTube Shorts and Instagram Reels.

| SLOT | EDITORIAL JOB | RECOMMENDED VIDEO TYPES | LENGTH |
|---|---|---|---|
| 08:00 IST | Discovery & learning | AI concept in 60 seconds; one useful tool/workflow; quick science explainer; myth vs fact; practical tip. | 30–60 sec |
| 20:00 IST | Story & depth | Women innovator profile; breakthrough explained; technology history; human-impact case study; future-facing story. | 45–75 sec |

**Important:** 08:00 and 20:00 are the target publishing times in India Standard Time. Use platform scheduling and verify each channel's audience analytics after 3–4 weeks. Do not assume these are universally optimal times; test and adjust based on retention, reach and audience activity.

## Video format standards

### A. The 60-second explainer

Hook → one clear question → simple explanation → real example → takeaway. Use animated labels, diagrams and on-screen keywords.

### B. The human story / innovator profile

Strong opening claim → person and context → problem they addressed → contribution → why it matters today. Use licensed or clearly labelled illustrative visuals.

### C. Myth vs fact

State a common misconception → reveal what evidence says → explain the nuance → invite a thoughtful question. Cite sources in caption/description.

### D. Technology in real life

Start with a familiar problem → show the technology → explain how it works → benefits and limitations → human impact.

### E. Research / breakthrough brief

What happened → who did it → what the finding actually shows → what remains unknown → why viewers should care. Never overstate early research.

### F. Tool / workflow demo

Show the outcome first → walk through 2–3 steps → show a practical use case → state limitations, pricing or access caveats when relevant.

## Short-form video production specification

**Canvas:** 9:16 vertical, 1080 × 1920 minimum. **Captions:** burned-in, high contrast, safe from platform UI. **Audio:** clean narration, controlled music bed, no copyrighted tracks without rights. **Visual rhythm:** change shot, crop, graphic or emphasis every 2–4 seconds when appropriate. **Branding:** small ASR LABS mark, consistent opening/closing language, one restrained accent colour. **Accessibility:** readable captions, clear pronunciation and no meaning conveyed by colour alone.

## A standard video beat sheet

| TIME | BEAT | VIEWER EXPERIENCE |
|---|---|---|
| 0–3 sec | Hook | A surprising question, visual or clear promise. No logo intro that delays the value. |

| TIME | BEAT | VIEWER EXPERIENCE |
|---|---|---|
| 3–10 sec | Context | Why the subject matters; establish the question. |
| 10–35 sec | Core explanation | One idea, broken into simple steps with examples or visual proof. |
| 35–50 sec | Meaning | What changed, who benefits, or what the evidence does not yet prove. |
| Final 3–5 sec | Takeaway / CTA | One memorable takeaway and a natural question or follow prompt. |

# 04 / Five-agent organisation

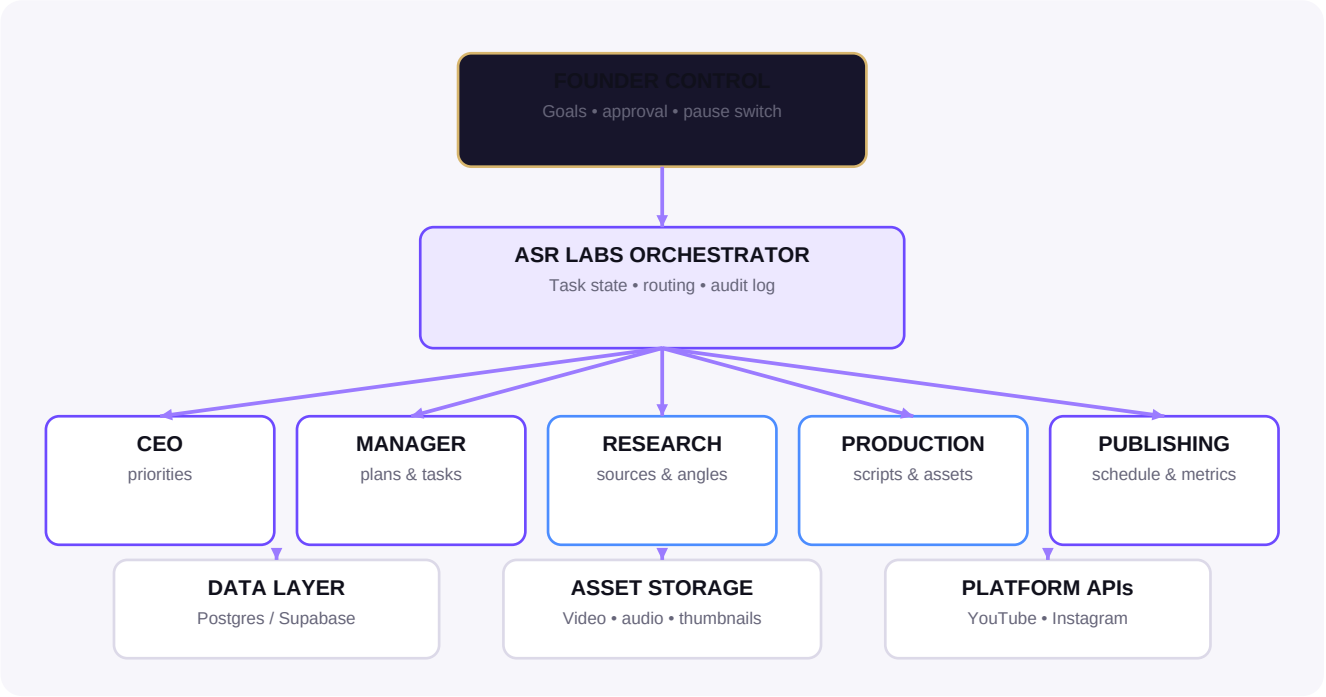

The agents operate as one coordinated team through a shared orchestrator and shared content records. They are specialised roles, not five independent chat windows.

## Operating roles

| AGENT | ACCOUNTABILITY | OUTPUT |
|---|---|---|
| AI CEO | Turns founder goals into priorities; delegates; resolves conflicts; monitors deadlines and business-level quality. | Weekly priorities, assignment map, status report, escalation list. |
| AI Manager | Converts priorities into production briefs, tasks, owners, dependencies, due dates and acceptance criteria. | Content brief, task plan, production calendar. |
| AI Researcher | Finds relevant topics and fresh angles; verifies claims using credible primary sources; tracks citations and originality. | Research dossier, fact sheet, source links, risk/uncertainty notes. |
| AI Production & QA | Creates scripts, shot lists, visual direction and edit packages; then independently checks facts, clarity, sound, captions and brand fit. | Script, storyboard, asset checklist, QA report and revision list. |
| AI Publishing Manager | Prepares metadata and platform variants; schedules approved assets; verifies successful publication and captures analytics. | Final caption/title, tags, schedule record, post URL and performance snapshot. |

# 05 / System architecture

The architecture separates the user interface, orchestration logic, agent services, persistent data, media storage and platform integrations. Keep credentials server-side and use official platform APIs only.

## Recommended technical stack

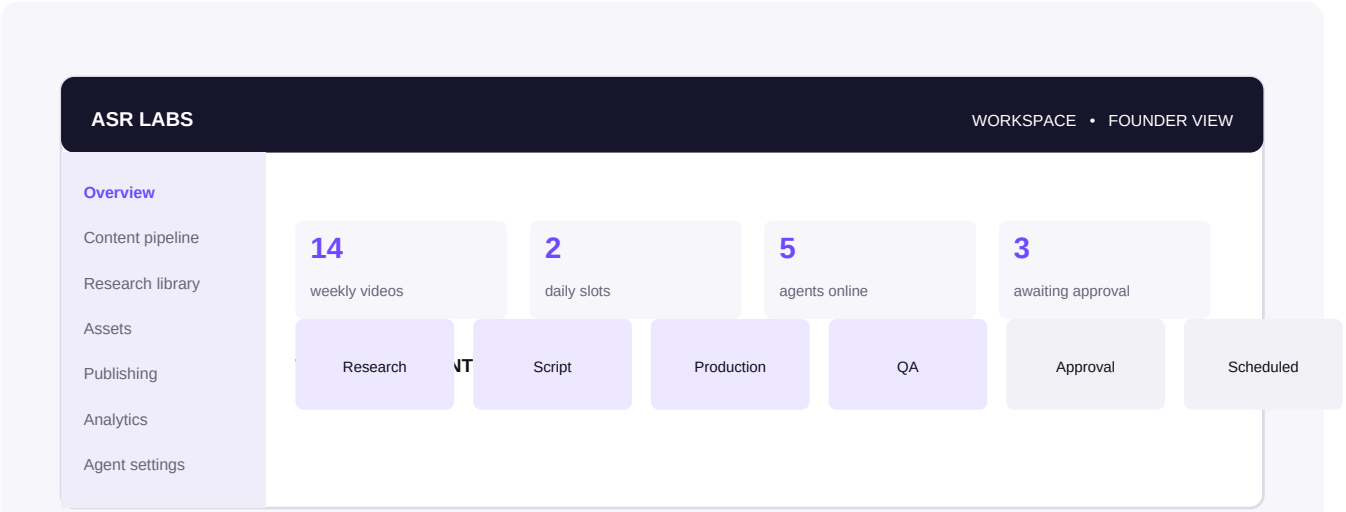

| LAYER | RECOMMENDED STARTING POINT | PURPOSE |
|---|---|---|
| Founder dashboard | Next.js + TypeScript + Tailwind | Review queue, content calendar, approvals, analytics and agent activity. |

| LAYER | RECOMMENDED STARTING POINT | PURPOSE |
| --- | --- | --- |
| Orchestrator / API | Python + FastAPI | Task routing, agent runs, workflow state, retries and scheduled jobs. |
| Agent intelligence | Model API adapters | Role-specific prompts, structured outputs, tool access and evaluation. |
| Database | Supabase / PostgreSQL | Content records, tasks, source citations, approvals, publishing jobs and audit logs. |
| Media storage | Supabase Storage or equivalent | Scripts, voiceovers, thumbnails, rendered videos and versioned assets. |
| Scheduling | Managed cron + worker queue | Trigger 08:00 and 20:00 IST publishing jobs; retry safely and alert on failures. |
| Platform integration | YouTube Data API + Instagram Graph API | Upload, schedule where supported, publish, retrieve post IDs and analytics. |

# 06 / Product wireframes

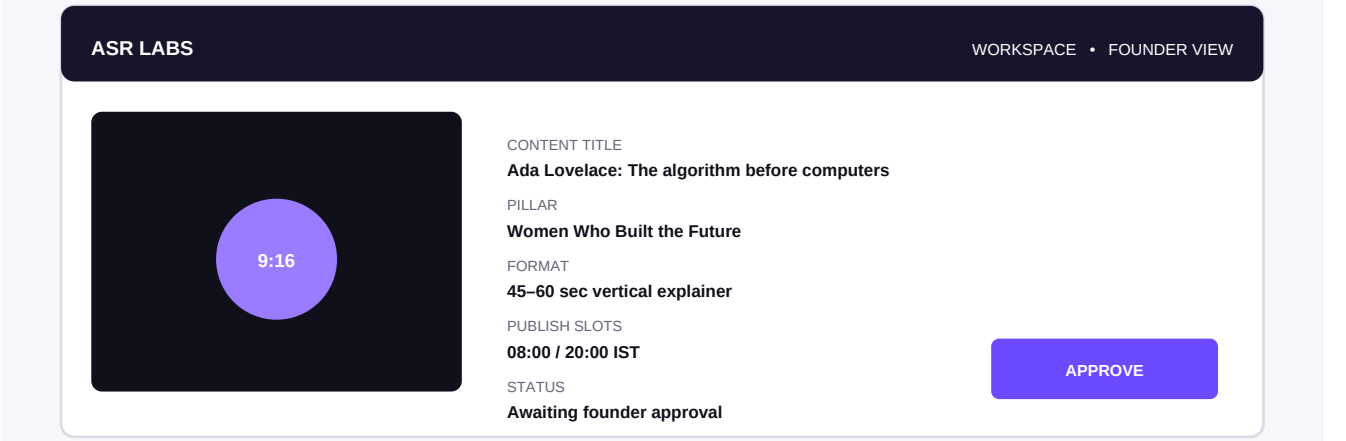

These are structural wireframes, not final UI designs. They define the minimum screens needed to operate the daily publishing system and can be translated into a polished Figma design or Next.js dashboard.

## A. Founder command centre

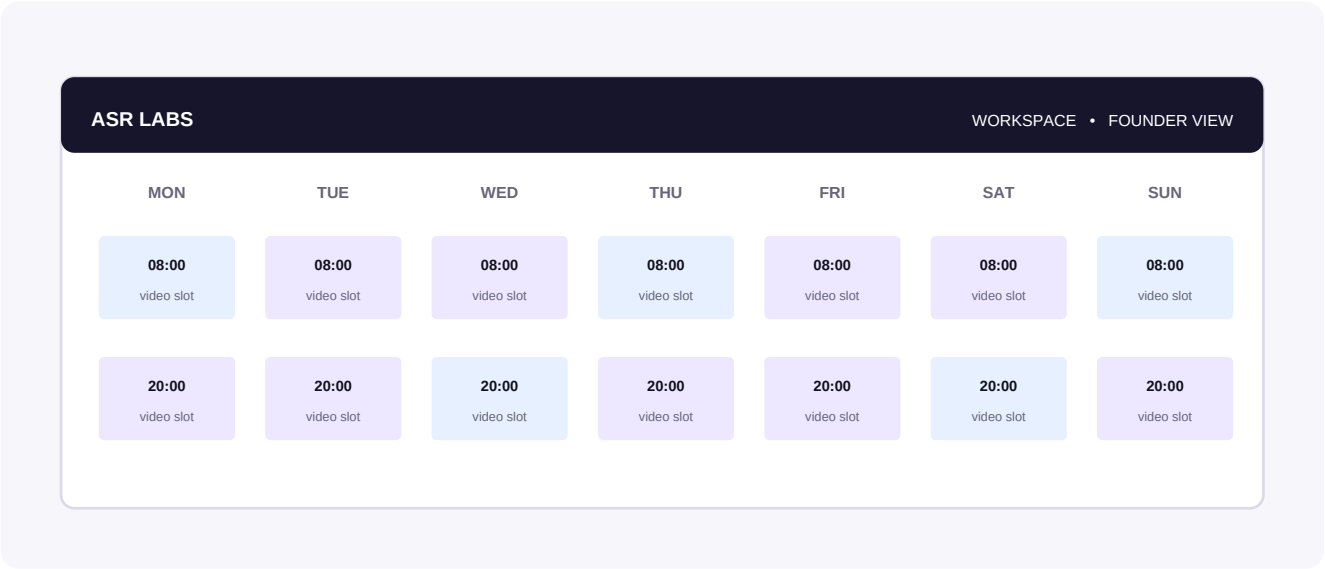

**Purpose:** one-screen operational view. Show today's two publishing slots, content pipeline, agent status, blockers, approvals and a clear emergency pause control. The founder should understand what needs attention in under one minute.

## B. Content review & approval

**Purpose:** compare the rendered video, script, sources, caption and QA checklist in one place. Approval must apply to an exact asset version. If the video, script or metadata changes after approval, approval is invalidated and the item returns to review.

## C. Publishing calendar

**Purpose:** a seven-day calendar with two daily slots. Each slot shows content title, platform status, scheduled time, assigned pillar and any failure or approval warning. Prevent two items being assigned to the same slot.

### Recommended navigation

Overview | Content Pipeline | Research Library | Production Assets | Approval Queue | Publishing Calendar | Analytics | Agent Settings | Audit Log

# 07 / End-to-end workflow

Founder goal → AI CEO prioritises → AI Manager creates briefs and tasks → AI Researcher verifies topic and sources → Production creates script/storyboard/video package → independent QA reviews → founder approves exact version → Publishing Manager schedules 08:00 or 20:00 IST → platform post is verified → analytics feed the next planning cycle.

### Content state machine

IDEA → RESEARCH → RESEARCH_APPROVED → BRIEF_READY → IN_PRODUCTION → QA_REVIEW → REVISION_REQUIRED (if needed) → AWAITING_FOUNDER → APPROVED → SCHEDULED → PUBLISHED. Any failed task is marked FAILED with a reason and retry policy. No agent may skip founder approval for public posts.

# 08 / Weekly production rhythm

To sustain 14 videos per week, work in batches. Do not research, script, edit and publish each video from scratch on the same day.

| DAY / CADENCE | WORK BLOCK | TARGET OUTPUT |
|---|---|---|
| Monday | Editorial planning + topic selection | 14 topic candidates; select 14 with 2–3 backups. |
| Tuesday | Research + fact-checking | Research dossiers and source-backed briefs for the week's videos. |
| Wednesday | Scripts + storyboards | 14 scripts, visual directions and platform-specific hooks. |
| Thursday–Friday | Production batch | Voiceovers, graphics, edits, captions and thumbnails. |
| Saturday | QA + founder review | All 14 assets reviewed, corrected and approved in batches. |
| Daily | Publishing + monitoring | 08:00 and 20:00 IST; verify post, log errors and capture metrics. |

# 09 / Data model & controls

## Core records

**agents**, **projects**, **content_items**, **research_sources**, **tasks**, **assets**, **approvals**, **publishing_jobs**, **analytics_snapshots** and **audit_logs**. Every content item should have a unique ID, owner, pillar, target slot, due date, status and version history.

## Non-negotiable safeguards

• Human approval is mandatory before any public post. No automatic publishing of unapproved content.

• Approval is tied to the exact rendered file, script and metadata version. Any change resets approval.

• Store API keys and OAuth tokens in server-side secrets management; never expose them in browser code or prompts.

• Use idempotency keys and platform post IDs to prevent duplicate uploads after retries.

• Log every agent action, source, approval, API response and publishing attempt.

• Provide a founder-controlled pause switch for all scheduled publishing.

• Use official platform APIs and comply with platform eligibility, rate limits, music and content policies.

• Label AI-generated illustrative images when viewers could mistake them for historical photographs or documentary evidence.

# 10 / Quality and performance scorecard

Measure more than views. Review performance by pillar, format, hook, length and publishing slot. Compare 08:00 and 20:00 after a meaningful sample, not after one or two uploads.

| METRIC | WHAT IT TELLS US |
|---|---|
| Viewed vs swiped away / opening retention | Whether the first seconds earn attention. |
| Average view duration / completion rate | Whether the story sustains interest. |
| Shares and saves | Whether the content is useful or worth revisiting. |
| Comments and meaningful replies | Whether the topic invites conversation. |
| Followers / subscribers gained | Whether videos build a returning audience. |
| Production cycle time and QA defects | Whether the operating system is efficient without lowering quality. |
| Publishing reliability | Whether both daily slots publish correctly and on time. |

# 11 / Implementation roadmap

| PHASE | BUILD | EXIT CRITERIA |
|---|---|---|
| 1. Foundation | Repository, brand tokens, database schema, login and dashboard shell. | Founder can log in and create a content item. |
| 2. Workflow | Task lifecycle, five agent roles, shared context and audit logs. | Agents can move a sample video through the workflow. |
| 3. Research | Topic backlog, source capture, claim verification and duplicate-topic checks. | Research dossier includes traceable sources and confidence notes. |

| PHASE | BUILD | EXIT CRITERIA |
|---|---|---|
| 4. Production + QA | Script, storyboard, asset checklist, independent QA and revisions. | A complete video package passes QA. |
| 5. Approval UI | Exact-version preview, founder approve/reject, pause switch. | Nothing publishes without founder approval. |
| 6. YouTube | Official upload integration, private test uploads, scheduling and verification. | One approved test video publishes successfully. |
| 7. Instagram | Professional account/API eligibility, publishing integration and verification. | One approved test Reel publishes successfully. |
| 8. Analytics | Fetch available metrics, compare slots and create weekly report. | Founder can review performance and adjust editorial mix. |

# 12 / Master operating instruction

You are the ASR LABS operating team. ASR LABS is a founder-led educational media company focused on AI, science, emerging technologies and the people shaping the future. Create accurate, accessible, original and visually compelling content for a global English-speaking audience. Every claim must be supported by credible sources; distinguish established facts from uncertainty; never invent statistics, quotations or citations; avoid repetitive topics and clickbait. The daily publishing target is two distinct videos: 08:00 IST and 20:00 IST. Work through the shared workflow, assign every task an owner and due date, preserve source and asset versions, and report blockers early. Production must pass independent QA. Public publishing requires explicit founder approval of the exact final video and metadata version. Use official platform APIs only, protect credentials, verify publication and log the outcome. The founder is the final decision-maker.

# 13 / First 30-day operating targets

**Week 1:** Build foundation and validate one video end-to-end. **Week 2:** Produce a 7-video buffer and test both daily slots. **Week 3:** Stabilise the 14-video weekly batch, QA and publishing workflow. **Week 4:** Review retention, shares, saves and slot performance; refine formats and editorial mix. Scale only when the quality bar and production capacity are stable.

## Founder principle

**Consistency creates the habit. Research earns trust. Storytelling earns attention. Quality earns the audience. ASR LABS should publish two useful videos every day—not two videos merely to fill a schedule.**
